## 100+ PARTS TO BUILD

### PRINTING

Print out the following 21 pages on at least 200 g/m<sup>2</sup> cardstock. Printing at 100% will result in parts for 28 to 32 mm scale.

### BUILDING THE OUTER BOX

Take part 1, the base of the outer box, and glue parts 2 to 5 to the sides of the base and to each other. You should now have an open box 7 inches wide and 8 inches long with the street walls of the club (5 inches high) facing outwards.

If you want a more sturdy floor and walls, you can insert pieces of chipboard or foamcore, before you start glueing in the inner walls. I recommend using 3 mm chipboard. Beware that you will most possibly need to trim the inner walls a little bit.

If you just want a thicker floor, you can also glue the extra cardboard to the outside of the box. When done with the box, glue the inner walls (parts 6 to 9) to their corresponding outsides: entrance to streetfront, emergency exit to backside, side wall to driveway, and bar to fire escape. Don't forget to cut the slits for the steps of the staircase into the inner backwall (part 7), and don't put glue onto the area underneath them.

Glue in the floor of the lower level (part 10).

### THE INNER WALLS

Start with the restroom wall (part 11). Fold the wall sides over and glue them together. Cut out the white slot, then glue the wall to the floor (indicated markings) and to the backwall (towards the stairs).

Next, build the other wall piece (part 13), cut out the slot, slot it into the restroom wall, and glue the flaps to their places on the floor.

Then build the staircase. Insert the side flaps of the steps, before glueing the sides of the staircase together. Then insert the flaps on the other side of the steps into the backwall, and finally glue the staircase to the floor.

### FURNITURE

Build the furniture. The table stands are supposed to form an X-shape with the upper glue flaps facing outwards (forming a square). Glue the table plates with their black side to those flaps.

Glue the bar onto its designated place. Leave the rest of the furniture to be put wherever (toilets and washbasin obviously go into the restroom)

you want, or so some punks can throw it around in a bar fight.

### UPPER LEVEL

Building the upper level starts with the floor (part 14). Cut it out, fold it over, but do not glue it together just yet. Cut out the section that says so. You should now have a floor with one corner missing.

Next, cut out the balcony railing (parts 15 to 17). Glue the parts into each other, using their side flaps (15 into 16 into 17). The flap of part 17 will go into the side wall of the office. Now glue the railing in between the floor layers, using the bottom flaps. Start at the long edge of the cut-out, then around the short outside edge and most of the front.

Finally, build the office. The side flap of part 17 is to be glued into the longer side wall (part 19) of the office. The side flap of this part goes into part 18, the office front, and the bottom flap of part 18 once again is glued between the layers of the floor (part 14). Glue the bottom flap of the side wall into the office, and the office floor (part 20) on top of it.

### BUILDING THE LID OF THE BOX

Cut out the roof base (part 21) and the side parts (parts 22 and 23). Fold parts 22 and 23 over along their middle lines, and glue them together, using the small flaps. Attach a 22 to a 23, that to the other 22, that to the second 23, and that finally to the first 22. You should now have a rectangle.

Fold the large flaps inwards, fill the insides of your frame with glue, and, finally, glue the upper flaps to the top of part 21, and the lower flaps to its bottom.

Glue the rooftop (part 24) on top of the lid.

Glue the ceiling (part 25) into the lid.

If you want a more sturdy lid, glue a 7x8 inches large piece of chipboard or foamcore into the lid, before glueing the ceiling into it.
