

SQUIRMYDAD'S URUTU BUILD

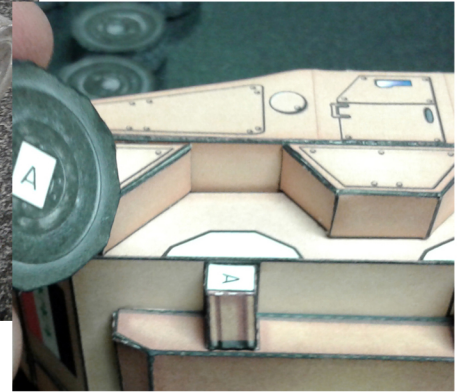

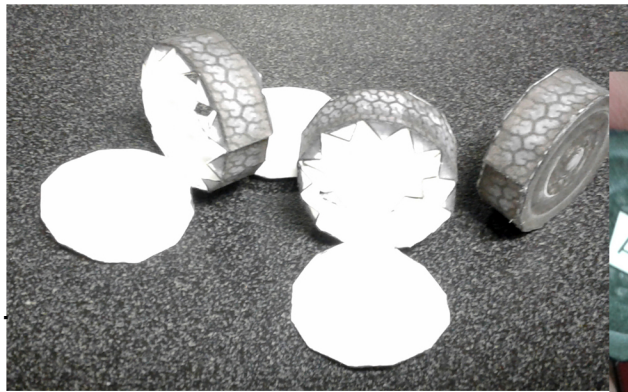

5] Missing another build pic, sorry, the hull bottom piece attaches to the undercarriage, make sure to line up the axle guides on the hull bottom piece with the guides on the undercarriage before glueing in place.

The axles are all the same and glue up into little tapered boxes. "A" goes on the outside, "B" goes on the inside so that the axles slope away from the hull bottom.

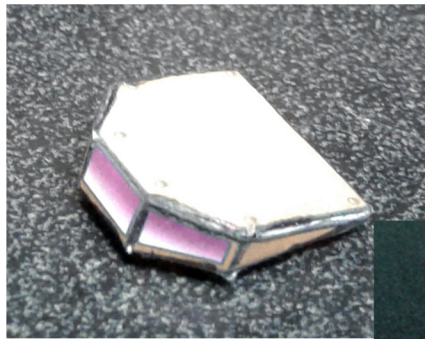

6] I hate building tires on papermodels, the Urutu has six. Loop the treads around into a circle before glueing up the sides.

Then attach the wheels to the axles and undercarriage.

7] The last piece is the driver's cupola. Folds up like this, attaches onto the upper hull as shown.

Enjoy!
